                                       The present sequence is cell cycle regulation protein-5 (CECRP-5) analytical method was used to identify this protein CECRPs are activators of cell proliferation or inhibitors of cellular process modulate proliferation. They are used to treat or prevent cell proliferative diseases like cancers, atherosclerosis, cirrhosis,
               hepatitis, psoriasis, deficiency syndrome
                                                                                                                          Claim 1; Page 70-71; 87pp; English.

The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511); expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins
This sequence is the Staphylococcus aureus trigger factor (tig) polypeptide of the invention. Tig polypeptides and polynucleotides are
                                                                              New Staphylococcus aureus trigger factor (tig) polypeptide and polynucleotide, useful as diagnostic reagents and for prevention treatment of Staphylococci aureus infections
                                                                                                                                                                                         Burnham MKR, Fosberry A,

Tig polypeptides (administered directly, in a vector and as a vaccine) and antibodies induce an immune response to immunise and prevent disease. Diseases diagnosed, prevented or treated include: bacterial infections, especially Staphylococcus aureus infections which cause otitis media, toxic shock syndrome, conjunctivitis, wound infection, impetigo and septic arthritis etc. Tig polypeptides, polypucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein by identifying mutations in the tig gene, or determining tig polypeptide or mRNA expression levels due to an infection of an organism with the tig gene. They can diagnose the stage and type of infection. Tig polypeptides are also useful for screening compounds which affect activity of the protein by measuring the binding to tig and observing the stimulation or inhibition of the polypeptide function. These can be used

The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY3584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          especially where the vocanitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Genome sequence of Chlamydia pneumoniae
                                                                    Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression -
                                                                                                                                                                                                                                                                    29-DEC-2000; 2000US-259128P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC certs in which poth alleles of a gene are modified, compiled, cone allele by insertion or replacement by a cassette having an CC expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous CC promoter, so that expression of the second allele is regulated by the CC promoter. (M1) is useful for constructing a strain of diploid fungal CC cells in which both alleles modified are useful for identifying a gene that CC cells in which both alleles modified are useful for identifying a gene that CC contributes to the virulence and/or pathogenicity of a fungus, a gene that CC contributes to the virulence and/or pathogenicity of a fungus, a gene that CC contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus CC and for identifying a therapeutic agent for treatment of a mammalian CC disease. (M1) is useful for identifying a compound which modulates the CC compound catabolism, biosynthetic, preferably enzymatic activity, carbon CC compound catabolism, biosynthetic, transporter, transcriptional, CC translational, signal transduction, DNA replication and cell division CC ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an CC essential Candida albicans protein used in the method of the invention.

CC Specification but is based on sequence information supplied to Derwent by the Control of the firm of the control of the printed specification of the printed of the printed control of the control of the printed to the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC protein by identifying mutations in the tig gene, or determining tig with the tig gene. They can diagnose the stage and type of infection. Tig colypeptides are also useful for screening compounds which affect colypeptides are also useful for screening compounds which affect continuity of the protein by measuring the binding to tig and observing the stimulation or inhibition of the polypeptide function. These can be used in treatment to inhibit or enhance tig activity, in addition to direct administration of tig polypeptides to treat conditions associated with a clack of tig polypeptide, or direct administration of antisense sequences to prevent expression. Tig polypeptides (administered directly, in a cc vector and as a vaccine) and antibodies induce an immune response to include: bacterial infections, especially Staphylococcus aureus conjunctivitis, wound infection, impetigo and septic arthritis etc. Tig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLO1840-ABL16175) and the encoded proteins (ABBC101840-ABL16175) and the encoded proteins

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                           The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689-AÄH62839) and encoded proteins (AAG84910-AAG85051) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp.
                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Figure 3; 626pp; English.

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

COILED
DOMAIN
         protein of Staphylococcus aureus and Staphylococcus epidermidis.";
Antimicrob. Agents Chemother, 35:2151-2154 (1991).
-i- FUNCTION: DNA GYRASE NEGATIVELY SUPERCOILS CLOSED CIRCULAR DOUBLE-STRANDED DNA IN AN ATP-DEPENDENT MANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED DNA RINGS, INCLUDING CATENANES AND KNOTTED RINGS.
-i- CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.
-i- SUBUNIT: MADE UP OF TWO CHAINS. THE A CHAIN IS PRESDANCIETED ACTIVITY AND CHAINS. THE A CHAIN IS PRESDANCIETED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STAEP

these signals, localizes, and then participates in assemiline.

M-line.

TISSUE SPECIFICITY: Localizes to the middle of A-bands.

SIMILARITY: Contains 1 DBL-homology (DH) domain.
                                                           nitted (APR-2002) to the EMBL/GenBank/DDBJ databases. FUNCTION: Structural component of the muscle w-line. Myofilament lattice assembly begins with positional cues laid down in the basement membrane and muscle cell membrane. UNC-89 responds to
